Abstract (en)
[origin: WO8300920A1] The apparatus for estimating the shots on a target is provided with two optical sensors (1, 3). One sensor is held at a fixed location of the trajectory of a target and allows the apparatus to determine the distance from the hole to the center of the target in the moving direction of the target (18). The other sensor is fixed to a transversal slide (38) which is movable perpendicularly to the moving direction of the target and measures the distance from the hole to the center of the target in a transversal direction. The two distance vectors are added vectorially by an appropriate calculator and multiplied by a rating factor. The result of the measurement may then be indicated as one tenth of a ring, printed or supplied to an information processing unit.
