Abstract (en)
[origin: US4516502A] A subcaliber projectile assembly especially for attack against active armor has an enabling projectile disposed axially ahead of a main projectile and in line and in end-to-end relationship therewith in a common sabot. The fin structures of the two projectiles are designed to increase the resistance of the main projectile so that it is retarded relative to the enabling projectile and strikes the target only after the enabling projectile has depleted at least one level of defense along the line of attack.
