Abstract (en)

A machine for unwinding yarn from a hank comprises a base (10) for securing a swift (12) non-rotatably, and an axle (14) rotatable in a hub of the swift (12) and in a hole 15 continuing through the base (10). A rotary sweep arm (20) passes through the axle (14) and is attached therein. An eyelet (22) is connected to a lower end of the arm (20) for movement around the the swift (12) in a plane transverse to the paper. A fixed eyelet (24) is provided on the axis of the swift (12). Yarn is unwound from a hank (not shown) on the swift (12), and passes along a path (30) through the eyelets (22, 24) to a wlexer (32) and a cone winder (34).
