Abstract (en)
[origin: US4482876A] A relay comprises an elongate armature which is seated at one end in a carrier of insulating material. Movable contact springs are anchored in the carrier and comprise extensions which emerge from the carrier and are secured in a base with respective fastening portions. Such extension of the respective contact springs forms a terminal lug integrated as a one-piece structure with the contact, as well as a friction-free bearing for the armature without provision of an additional bearing element.
