Abstract (en)

[origin: WO8301235A1] The device comprises two parallel groups of floats (1, 2). Each group comprises a horizontal float (3, 4) to which vertical floats (5-14) are attached through one of their ends, the other ends being attached to longitudinal beams (17, 18). The end of one group is linked to the end of the other group by means of two horizontal transversal floats (15, 16) and a box-girder (19). The longitudinal beams carry movable supporting beams (20-23) which can be placed under the load to be hoisted and transported. The supporting beams (20-23) are provided at their ends with forks which can cooperate with supports attached to the load. The ends of the support columns of the barge have a shape and a relative position identical to those of the columns of the main structure. The method comprises, amongst other operations, hoisting the load by means of the support legs thereof.
