Abstract (en)

Panels (10-14), for example hatchcovers in a ship, are moved from an end-to-end disposition into a vertical stack by means of a system comprising link elements (41-43) at the edges of the panels, a lifting force being applied to the panels via the link elements. The link elements may comprise telescopically-connected hook-shaped elements, the top element (41) being attached to the top panel (10).
