Abstract (en)

The visual display device is intended for connection to a processing system which detects parameters characteristic of the instantaneous operational state of a motor vehicle and parameters characteristic of the change of this operational state within time. The device includes a visual display unit (2) having separate zones (5, 6, 7) each of which is intended for the presentation, in alternation, of at least one pair of the said signals, and a selector (3) connected to the visual display unit (2) and the operation of which causes the simultaneous alternation of the respective signals on each of the said zones (5, 6, 7).
