Abstract (en)
[origin: US4550718A] The present invention relates to a facial massage device comprising a support formed of a handle (11) terminated by a curved section (12) which supports a massage plate (13) in which there are provided a series of openings (15) intended to retain rotary massage balls (14). A central ball (17) is connected by a rod (18) to a ball joint (19) embedded in a socket (20) in the part (12) of the handle (11). The balls (14) protrude extensively from the plate (13) which serves as support for them, and the assembly consisting of the ball and plate (13) is highly movable with respect to the handle (11) due to the double articulation formed by the central ball (17) and the ball joint (19).
