Abstract (en)

[origin: EP0092527A2] The air humidifier device 11 is designed to be placed inside groups that deliver hot air, such as convectors 1, unit heaters and the like, and it comprises a container 12 for water crossed, at least in part, by tubular elements 18 through the inside of which hot air can pass. The inner surface of the container 12 is partially faced with panels 21 of a porous absorbing material. The said tubular elements 18 have overhead a concave cover 19, the concavity of which faces downwards and this is designed to direct the hot air towards the surface of the water in the container 12.
