Abstract (en)

[origin: EP0092595A1] An intake manifold with its trunk portion (9a) connected to a carburetor (10) and with its branch portions (9b) connected to the cylinder heads (5) of the multi-cylinder engine. In order to achieve increased output power of the engine at all levels of operation at minimized reduction of acceleration responsiveness in a low output range as well as low cost production of lightweight and simple construction, each branch portion (9b) of the intake manifold (9) is partitioned into a first (8a) and a second (8b) intake passage by a partition (9c) and control valves (12) adapted to be opened during light output operation of the engine only, are arranged in the second intake passages (8b) of all branch portions.
