Abstract (en)
Oscillatory locking and operating means in a system for individual operation between two turning positions of especially a large number or closely arranged sinkers, needles, healds or like axially mobile elements having transversely projecting abutments or projections adapted to cooperate with the locking and operating means. The locking and operating means include guiding means (A, B) movable as well longitudinally as transversely of the sinkers and actuable by an outer operating means and provided with locking elements or projections (31, 32, 13, 14) also movable generally transversely relative to the guiding means, said locking sections or projections being formed and adapted in cooperation with each other and with the guiding means during a minimum transverse movement to act upon the abutments or projections (1, 11) of sinkers or like elements (4) actuable by the locking and operating means.
