Abstract (en)
[origin: EP0093989A2] A Z-profile sealing membrane, which is readjustable by hammer force and at the same time is secured against resetting, is mounted via a clamping block on the door body which is in turn fixed in the particular position by a holding bolt and a wedge plate. For this purpose, the side of the clamping block away from the door body is formed with an inclination which corresponds to the inclination of the wedge plate so that, via the holding bolt and an additional securing spring element, the necessary frictional forces for fixing the clamping block and hence the Z-profile sealing membrane are provided. <IMAGE>
