Abstract (en)

[origin: EP0094034A2] A detergent distributor for a laundry washing machine comprises a reciprocating piston for controlling the supply of water to individual compartments containing detergents and/or additives. The piston is actuated by a cam of a program unit of the machine through a lever system. According to the invention, the operative connection between said cam and said piston is accomplished by a pair of pivotally mounted and interconnected levers one of which carries a cam follower element biased into engagement with said cam, while the other is connected to said piston and provided with play adjustment means in the form of an eccentrically mounted shaft which by means of a suitable tool is rotatable from the outside of the machine for displacing the fulcrum point of said other lever.
