Abstract (en)

[origin: EP0094471A1] The apparatus comprises a vertically extending magazine, of the carousel type (1), bearing the piece goods (9) to be supplied, as supported on suitable mandrels (8), and which piece goods are discharged, according to a programmable sequence, on a provided loading device. The latter comprises a first carriage pair (14) which, by firmly engaging the ends of the piece bearing mandrels (8), transfer the piece goods (9), in a co-ordinated way, from the mentioned magazine (1) to the spreading machine turret. A further carriage pair (15), on the other hand, is effective to displace the mandrels (8) discharged by the spreading machine to the vertical magazine (1). The apparatus according to the invention, in particular, is able of finding, selecting and preparing the piece good (9) on the vertical magazine (1), for loading the piece (9) on the spreading machine and, moreover, it is effective to load the piece and discharge the mandrel from the spreading machine, according to the order in which the piece had been previously loaded on the vertically extending magazine.
