Abstract (en)
[origin: EP0094662A2] 1. Rendered facade with heat and cold insulating slabs on which a coat of mortar and rendering is applied, including a mesh-type fabric, whereby distributed on the outer surfaces of the heat and cold insulating slabs, individual protruding spacing elements are joined on in single pieces, whereby the fabric, being supported by these spacing elements, is embedded in the coat of mortar and rendering. This facade is characterized by the fact that the height (13) of the spacing elements (11) corresponds to the thickness of a basic coat of rendering (16), that the basic coat of rendering (16) fills out the space between the fabric (20) which has been applied and the outer surfaces of the heat and cold insulating slabs (10) and that on the basic coat of rendering (16) a finishing coat of rendering (21) is applied, completely embedding the fabric (20).
