Abstract (en)

The present invention relates to an alternating supply device for the spray arms on a dishwashing-machine which is fitted inside the end of the supply pipe (1), one outlet of which comes out directly inside one of the spray arms (12), while the other is designed so as to create a free jet for the other spray arm. The said device also provides for adjusting the ratio between the amount of water supplied to one spray arm and the amount sent to the other spray arm, while a preferred solution is activated by one of the spray arms themselves via an appropriate gear mechanism.
