Abstract (en)

[origin: US4561355A] The invention relates to a device for fixing a plate on a cylinder, while permitting to quickly control, at certain instants, the application and fixation of this plate on a particular angular portion of this cylinder and, at other instants, the disengagement of this plate. It is characterized by the fact that, in addition to means (9) enabling the plate (3) to be brought against the cylinder or, on the contrary, separating it from its area of support, it comprises means (10) for fully applying on the cylinder both the median portion and the ends of the plate. Application to the mechanical construction industry and, more particularly, to rotary printing and cutting machines.
