Abstract (en)
A screen printing machine hving a material conveyor driven by a power source, such that it is able to convey the material (3) to and to come to a halt at a printing position, in which print corresponding to the pattern on a stencil may be applied to the material, in addition to which the material conveyor is so affected by the power source that the material conveyor is driven at a high speed which, before the printing position for the material is reached, is reduced to a low speed so that the material is slowly advanced to its printing position. The front edge (3c min) or similar of the material is capable of being sensed as it assumes a pre-determined position by means of a registration device (20,22) which does not touch the material, so that the material may be caused to stop by activation of the registration device.
