Abstract (en)
A snow plough (10) comprises a pair of blades (22, 23) which, in a normal position, comprise a 'V' formation, the trailing edge of each of which is pivotally connected to support means (18). The blades (22, 23) are operated alternately by drive means (30, 31, 32 and 33) so that, when the plough (10) is driven forwardly into snow with the apex of the 'V' leading, the snow is swept laterally of the path of the plough (10) alternately in opposite directions.
