Abstract (en)

[origin: EP0099957A1] 1. Device for the transportation of recording carriers in printers, particularly in matrix printers, with one or more insertion channels formed tangentially to the print roll, for individual or continuous forms or for continuous webs, and also with two sets of pressure rollers associated with the print roll, which are consecutive in the direction of movement of the recording carrier, characterized in that at least for the insertion of individual sheets or at least a continuous web, when the two sets of pressure rollers (5, 8) are in engaged state, the second set of pressure rollers (8) is provided with a free run (8b) in the feed direction (8a) of the recording carrier (3b), so that when a brake (12) is engaged on corrugation of the recording carrier (3b) and rotation of the print roll (1) by a fraction of the circumference of the print roll towards the feed direction (8a), the free run locks and the recording carrier is applied taut against the print roll (1).
