Abstract (en)  
[origin: US4502805A] A deposit container for printers for the deposition of sheet-like data carriers which are delivered by means of a platen is pivotably disposed above the platen to permit selective sheet stacking in upwards or downwards sequence. A pair of transport rollers are arranged adjacent the accepting end opening of the deposit container to be spread apart during sheet introduction into the container and to be moved together to form a drive nip for the sheet after it has passed through the printing zone and lift it into the deposit container. Pivotal flap valves are mounted on the container walls, which are adjusted in dependence upon the pivot position of the deposit container to assist the deposition of the individual sheets.
