Abstract (en)
[origin: EP0101081A1] 1. Orthopedic apparatus for treating vertebra defects of persons, comprising a base frame being displaceable vertically or almost vertically, accommodating one person and stretching his/her spine (14, 16; 72), as well as a first element (48, 88) acting intermittently on a part of the spine, at least almost vertically to the stretching arrangement of the person, wherein the first element (48, 88) is adjustable in height and for the purpose of producing any individual shock whatever, said element is configured as a back shock device of knob shape acting shock-like vertically on the part of the spine, controllably prestretchable under elasticity or as a flywheel mass controllably swivable against gravity, with release.
