Abstract (en)

A method of deriving three dimensional image information from an object using nuclear magnetic resonance signals is described. The method comprises subjecting the object to a continuous, static magnetic field and carrying out the following set of sequential steps.1. Exciting nuclear spins in a volume;2. applying non-aligned first ($G_x^{(2)}$), second ($G_y^{(2)}$) and third ($G_z^{(2)}$) gradients of the magnetic field;3. causing the spins to rephase periodically in the presence of the first gradient ($G_x^{(3)}$);4. phase encoding the spins in the direction of the second gradient ($G_y^{(3)}$) prior to every read-out of the rephased FIS from the object;and then successively repeating the above set of steps with different values of gradient of the third gradient ($G_z^{(2)}$), there being a recovery interval between the repetition of successive sets of steps.
