Abstract (en)

[origin: EP0105216A2] The wrapping takes place on a machine conveyor belt, which takes the goods and also a film curtain along by virtue of inherent weight friction. In order to prevent very lightweight goods being retained by the web tensioning, there is provided on the machine conveyor belt a driver which seizes the web and, under the influence of a control curve, has one end position outside the film region and one end position projecting into the film region and clamping the film. <IMAGE>
