Abstract (en)
[origin: EP0105537A2] A flexible inner container (4) in the form of a folded-up laminated bag is situated in a dimensionally stable outer container (1) which is closed by a lid (2) provided with a discharge valve (3). In the intermediate space between the outer container and the inner container there is a pressurised propellant (T). The laminated bag (4) is attached to the discharge valve either directly or by means of an adapter inserted in said bag and is retained in its folded-up form by a band (45). Its maximum capacity is greater than the volume of the outer container. The two-compartment container is inexpensive, allows the greatest possible degree of filling and can be filled without any special know-how even by the manufacturer of the filling product.
