Abstract (en)

[origin: US4526046A] A method and apparatus for transferring a liquid sample. The apparatus includes a positive displacement syringe having a storage tube having a central storage chamber therein, a plunger slidably mounted in the upper end of the storage tube, and a cannula connected with an opening which is contained in the lower end of the tube. The apparatus further includes a device for preventing the formation of gas bubbles during the introduction of liquid into the chamber. The device includes a generally cylindrical body member which is vertically arranged within the storage chamber. A portion of the lower end of the body member cooperates with the lower end of the storage chamber wall to define a plurality of liquid passages. The body member remains in contact with the lower end of the storage chamber when liquid sample is aspirated into the storage chamber. The method includes the use of the apparatus for transferring a liquid sample.
