Abstract (en)

[origin: EP0107237A1] 1. Process for the control of the microstructure of rolled steel products subjected to a controlled cooling from a temperature above their upper transformation point, characterized in that the transformation temperature is determined at at least one point of at least one section of the product, in that the mean transformation temperature of the said section is calculated, in that this calculated value is compared to a set value of the said mean transformation temperature and in that the conditions of the said cooling are modified so as to reduce, preferably to eliminate, the difference found between the calculated value and the set value of the said mean transformation temperature of the section.
