Abstract (en)

[origin: WO8303716A1] The mobile miniature radio receiver has, as antenna, an elongated dipole. The antenna wires extend along the edge of one or a plurality of printed circuit boards of the receiver and are connected at their ends to conducting surfaces. The conductor tracks of the board or boards, which extend in parallel to the antenna form an ohmic-capacitive shunt and are therefore, for the RF signals, uncoupled at the surroundings of the antenna base.
