Abstract (en)

[origin: EP0109136A1] In order to provide controlled resilient biasing of a movable check roller (12) that roller is mounted at an intermediate position on a first leg (15) of a spring bar (14), and the free end (19) of that leg is restrained to a wall (4) of a generally S-shaped bracket (1) by a pivotal engagement between a recess (20) in the bar and the wall (4). A second roller (13) is conveniently mounted on a second leg (16) of the bar. In one arrangement the second leg (16) is rigidly held against lateral movement, but in another arrangement the second leg is capable of restrained movement in a similar manner to that of the first leg.
