Abstract (en)
[origin: EP0110085A2] In a store, preferably for foodstuffs, behind a controllable customer entrance there is at least one operating point for articles of a particular type, with price indicators. In front of the customer exit there are payment points with tills and where appropriate receipt printers. For an error-free easily controllable mode of operation, identification cards containing characteristics are received by the customer in front of the entrance and contain a machine-readable zone with the characteristic. At the entrance there are reading points of a recorder where these characteristics are detected and fed to a central computer and serve as addresses for all further transactions. At the various operating points there are also reading points for identity cards. At the exit there are translation units with further reading points for the identity card which, for the read-off characteristic, block all the units of the operating and where appropriate payments points as well as the central computer for reception of further data of these identity cards. <IMAGE>
