Abstract (en)
[origin: EP0111224A2] In order to improve a rescue device for reducing the risk sinking on vessels or similar floating bodies in such a way that a reduction in the risk of the ship sinking, exceeding what can be achieved with known devices, as well as a considerable increase in the chance of survival of the persons on the vessels can be achieved with simple means in a space-saving manner, displacement spaces (2, 3, 4) which can be pressurized with air or other gaseous media and can thus be increased in their volume if there is a loss of buoyancy in the vessel (1) or the like are arranged in the same in such a way that they can compensate for the loss of buoyancy in the vessel (1). <IMAGE>
