Abstract (en)
[origin: US4589159A] A toothbrush whose handle is provided with a disc-shaped or otherwise configured indicia-bearing member extending laterally beyond one or both marginal portions of the handle. The indicia-bearing member can constitute that end portion of the handle which is remote from the bristles, such member can be adjacent to this end portion, or such member can be nearer to the bristles than to this end portion of the handle. One or more hooks and sockets can be provided on the indicia-bearing member to facilitate suspension of the toothbrush in such orientation that the bristles are located at the upper or lower end of the handle. The indicia-bearing member is formed with a flat, concave or convex surface which carries one or more indicia-bearing labels and is surrounded by a raised border.
