Abstract (en)

[origin: EP0118664A2] The device, which comprises a multiplicity of essentially flat carrier elements (6) which are parallel to one another and which can be pushed to and fro by means of a roller bearing between a storage position and a presentation position, is intended to enable the possibility of an industrial prefabrication in an improved way and the installation independently of the ceiling construction and the room height. For this purpose, provision is made that every carrier element (6) has, at its top (13), guide rollers (14) which can be rotated around vertical axes and which are guided in a guide rail (5) which is mounted in a fixed position, engages over the rollers and is U-shaped in cross section, and that running wheels (7, 8) are arranged at the bottom of the carrier element (6) and run at least partly on rails (30, 32). <IMAGE>
