Abstract (en)
[origin: EP0118768A2] The individual ventilators used for the pressure ventilation are switched on by means of a control device a number of times, preferably three times, per day for a given running time which can for example be adjusted to ten minutes. This rhythm determined by the control device is interrupted whenever the room is used, i.e. when the room lighting is switched on in the internal room, and is only started again from the beginning in the intended cycle after the room lighting has been switched off or after expiry of the stipulated after-running time of the ventilator.
