Abstract (en)

A method for constructing a building with two or more stories, of which at least the first story comprises one or more houses, and a building constructed by said method. According to said method at least two supporting constructions extending along the whole depth and height of the building are erected at a distance from each other and each on a corresponding main foundation. A bearing floor is provided between two adjacent supporting constructions at least for the first and next stories. Fully prefabricated houses, each having its own supporting floor, upstanding walls and a ceiling are placed on supporting blocks on the bearing floors. Vertical line shafts are provided in the supporting constructions, through which main lines for electricity, sewerage and the like are led. Each house is connected to these main lines by means of connection lines which are led through the space between the floor and the bearing floor.
