Abstract (en)
A packaging machine is for packaging articles in flexible sheet material, particularly articles which may be compressed to occupy less space in the resulting package. The machine includes a support 10 for the articles and a rotatable member, preferably a roller 25, located above the support. Relative movement between the support and roller causes the article, enveloped in the sheet packaging material, to pass between the support and the roller. The roller has yielding means about its periphery so that the article causes compression of the yielding means during movement of the article between the support and the roller and compression of compressible articles. As the article is discharged from under the roller the packaging material is sealed around the article.
