Abstract (en)

[origin: EP0119940A2] 1. A metallic framework system to bind together two pieces of structural concrete, of the type comprising a bed (3) of friable material which, intended to be placed in the shuttering of the first structural piece, serves to accommodate those portions (6) of the framework (4) that are to be included in the second structural piece and from which project portions (5) of the framework (4) that are to be included in the first structural piece, characterised in that the inner surface of the bed of friable material (3) in contact with the concrete of the first structural piece is covered by at least one band (7) or the like extending beyond the bed of friable material in such a way as to remain accessible at the level of the visible face of the latter after removal of the shuttering of the first structural piece.
