Abstract (en)

A hanger (2) comprises a spine (4) and an array of prongs (6) projecting from the spine. The prongs taper from the spine and are triangularly-based pyramids. Apertured parts (8) to be coated are pushed onto the prongs, prior to lowering the hanger, into a coating bath. The invention provides secure attachment of the parts on the hanger and good electrical contact between the parts and the hanger. The latter is of advantage in electrical coating processes.
