Abstract (en)
[origin: DE3239887A1] Process for the production of oligonucleotides by cross-linking successively isolated or several units of nucleosides and/or nucleotides in homogenous phase by using a bi-, tri- or tetrafunctional carrier molecule having the general formula $Sp(X)_n$, wherein X is a reactive group compatible from the point of view of the nucleotide chemistry and n is an integer between 2 and 4, wherein builds up little by little on the carrier molecule the sequence $Sp(X-N_{<1>-N_{<2>}...N_{<m>})_n$ and where from the oligonucleotide having the formula $N_{<1>-N_{<2>}...N_{<m>}$ is finally released.
