Abstract (en)
[origin: EP0124886A2] In the covering for a wall (1) or ceiling composed of wood panels (9) provided on their longitudinal sides with grooves (10), the panels being mounted by means of claws (7), engaging in the grooves (10), on profiles (2), the claws (7) are guided slidingly on the profiles (2) and the profiles (2) are fastened to the wall (1) or ceiling by means of anchorages (3, 4) which consist of screws (3) as tension elements, which engage through the profiles (2) into plugs set in the wall (1) or ceiling, and of elastic spacers (4) as flexible compression elements directed oppositely to the tension elements and cooperating with them, which are supported against the wall (1) or ceiling and against the profiles (2). The substructure of this covering, consisting of the profiles (2), can be mounted, and above all adjusted, particularly easily and quickly by means of the screws (3) and elastic spacers (4). The sliding guidance of the claws further simplifies the mounting. <IMAGE>
