Abstract (en)
[origin: EP0124895A1] 1. A device comprising plug connections for the connection of coaxial wide band cables to a cable sleeve which is shrunk on in the region of the connection, where the cable sleeve has cable input sleeves which correspond to the plug connections of the device and are capable of being shrink-fitted and which protrude outwardly from the cable sleeve in a finger-like fashion and where at least one of the cable inputs (7, 8, 9, 7', 8', 9') is provided with a sealed, detachable terminal cap at its distal end, characterised in that an electrically adapted, disconnectable terminal resistor (Z) is respectively arranged at the plug connections (5) of the cable inputs (7, 8, 9, 7', 8', 9'), that a disconnection device (18) is arranged for each terminal resistor (Z), and that there is arranged a locking device for the respectively inserted cable, which locking device is rendered effective by the introduction of a cable.
