Abstract (en)

[origin: EP0126979A2] In a device for receiving and fixing pole-shaped elements, such as Christmas trees, sunshades, rotary airers or the like, having a foot and an essentially hollow-cylindrical receiving body in the centre of the foot, a solution is to be provided to guarantee that the inserted pole-shaped elements are held in the vertical position without requiring screw connections or the like. This is achieved in that a centring cone (4, 4') is provided at the bottom end in the region of the foot (2) in the interior of the cylindrical element (3) and, on the edge side, inwardly facing clamping springs (7) are provided in the upper region of the cylindrical element (3). <IMAGE>
