Abstract (en)
[origin: EP0128549A1] 1. An alarm system comprising several signal stages (2, 4, 6, 8) connected up via a blocking stage (25-1 to 25-4) each to a joint evaluation stage (10) which triggers an alarm limited in time in response to the signal of one of said signal stages via at least one alarm stage, said blocking stage limiting the duration of the signal involved and permitting a new signal via a flip-flop (N1, N2), into the set input of which said signal is fed, only after said signal involved has been eliminated, characterized in that the output of said flip-flop (N1, N2) of each blocking stage (fig. 2) is connected up to the input of said evaluation stage, the first input of an AND circuit (D2, R2, T3, T4) and to the reset input of said flip-flop via a timing element (P, C1), in that the inverted signal is fed into the second input of said AND circuit and in that the output of said AND circuit is fed into said reset input of said flip-flop.
