Abstract (en)

[origin: WO8402371A1] A device for connecting vertical and horizontal elements (1 respectively 2) comprises hook elements (5) welded to the ends of the horizontal elements, wedges (13) displaceable in said hook elements and yokes (3) welded to the vertical elements. The wedges (13) have upper and lower portions (14a respectively 14b) which bear against the vertical elements above respectively below the yokes (3) when the hook element is hooked in the respective yoke and the wedge is pressed down. The hook element has guides (10 respectively 12) for guiding the wedge and stop means (21) which prevent the unintentional removal of the hook part. The wedge is measured so as to remain by means of gravity in an inactive ready position resting upon an additional stop means (20) supported by the first-mentioned stop means (21).
