Abstract (en)

[origin: US4714153A] The can transporting device transports the cans by using rails which are driven synchronously by crank drives. In one embodiment, the cans rest on a floorplate while the rails are moved so as to transport the cans in a forward step-wise manner along the floorplate. In non-linear arrangements, straight rails are jointed to each other by curved rails. In this embodiment, an additional crank drive is provided to support the outer curved rail for vertical movement. The transport direction of the cans can be selected through selection of the direction of rotation of a gear motor which drives the transmission for the crank drives.
