Abstract (en)

In a helical scan-type video tape recorder, a tach signal is generated as a reference signal when the rotating heads (2, 3) trace the vertical blanking period recorded portion of the tracks on a magnetic tape (1) moving at the standard speed, and this reference signal and a signal indicative of the level-reduced portion (N) of the reproduced video signal (V) from the rotating heads are compared in phase with each other to produce a phase difference signal (T), by which the transportation of the magnetic tape is controlled so that the level-reduced portion coincides with the vertical blanking period of the reproduced video signal.
