Abstract (en)
[origin: EP0131250A2] In a refrigeration plant with an evaporator, in which a so-called submerged operation can be used, it is proposed, in order to improve the k value, to provide an inclination of the evaporator in the direction of flow. In this connection, a uniflow current of coolant and medium to be cooled is established, since in each case the feed takes place in the region at the bottom and the outlet in the region at the top of the condenser.
