Abstract (en)

[origin: EP0131347A2] A closed cylindrical housing is provided with a first cylindrical member secured to the bottom of the housing. A second cylindrical member concentric with, but of lesser diameter than, the first member passes through a housing cap. The second member terminates in spaced relationship with the bottom of the housing. Liquid or foam supplied to the interior of the housing through the second member rises between the first and second cylindrical members and enters an annular space defined between the first member and the cylindrical housing. A plurality of spaced apertures in the housing communicate with the annular space and serve as outlets for the discharge of liquid or foam.
