Abstract (en)
[origin: US4602465A] Substantially cylindrical and relatively thin-walled large volume containers such as silos are interiorly supported by means of a supporting structure in the form of a triangular supporting triangle, which is fixedly joined to the inner container wall. Thereby an essential amount of radial loads is converted into loads working in circumferential direction, i.e., working tangentially on the container wall, so that the risk of deformations is reduced when the load transmitting members such as pipes provided inside the container are joined to the supporting structure.
