Abstract (en)  
[origin: US4528901A] Machine for peeling cereal grains, especially rice, by means of rubber rolls. Above the rolls (1,3) there is a bin (7) for the supply of material. An arrangement (13-18) is present, which cuts off the supply of material and/or separates the rubber peeling rolls, when a minimum loading (10) in the bin has been passed in the downward direction. The bin is mounted on springs (9) so as to be movable up and down, so that its position in the vertical direction is dependent on the degree of loading. The bin cooperates with a control (15) which is arranged fixed on the frame and which is changed over when the container reaches a high level because of its minimum loading, for separating the rolls (1,3) or for turning off the material supply. The control is again changed over when the bin has moved downwards again because of attaining a higher loading (11).
